

Liver and Gallbladder Cleanse According To Dr. Hulda Clark

Ingredients You Will Require

1/2 cup (4 fluid ounces = 1.25 dl) Extra Virgin Olive Oil

1 big pink grapefruit (or 2 small) (or 3 lemons) yielding 3/4 cup (6 fluid ounces = 188 ml) of fresh juice

4 tablespoons Epsom Salt = MgSO₄ (Magnesium Sulphate = Epsom salt)

3 cups water (24 fluid ounces = 750 ml)

The photo reproduced below was obtained from Edward C. Klatt MD, University of Utah Health Science Center, which retains the copyright.

Multiple yellow-tan faceted gallstones are seen in the opened gallbladder pictured here.

It is possible for a stone to exit the gallbladder via the cystic duct. It may then produce obstruction of the cystic duct, or it may get into the common bile duct and produce an obstruction there. It may obstruct the ampulla of Vater and produce pancreatitis. Biliary tract obstruction leads to jaundice with increased total and direct bilirubin in the blood serum.

Judging from the size and number of the stones, such stones have been created inside liver, inside the hepatic bile ducts, and then migrated to the gallbladder. Individuals having such small stones inside their gallbladder can easily cleanse them with the liver-gallstone cleanse. When your gallbladder is so full of stones, you can surmise that you may have about 2000 small stones inside your liver. Gallstones are not only green, they can be any color!

Points Of Clarification

Individuals using our Candida Clearance Rotation Protocol Should Wait At Least Four To Six Weeks After Starting The Protocol To Begin This Program! This will provide a sufficient degree of parasite clearance from the system to make the liver cleanse effective.
Be sure to use the primary remedies at their maximum dosage for at least two weeks before doing the liver cleanse.

Be aware that it may take 5 - 10 flushes at two week intervals to completely

cleanse all accumulations from your liver. (Some individuals have eliminated as much as 2000 "stones".)

Even after your first flush, your liver will function more efficiently.

You do not have to do all 5 flushes, if on the 2nd, 3rd or 4th flush you no longer eliminate any "stones".

Even just one year after the initial cleanse, your liver may build up enough "stones" to warrant another flush.

For maintenance it is suggested to perform one flush in every 6 months.

Following such a schedule will make your digestion better than ever. It may be even better than when you were a child.

You may need only half of the food that you have eaten before the flushes.

"Cleansing the liver of gallstones dramatically improves digestion, which is the basis of your whole health. You can expect your allergies to disappear, too, more with each cleanse you do! Incredibly, it also eliminates shoulder, upper arm, and upper back pain. You have more energy and increased sense of well being. It is the job of the liver to make bile, 1 to 1.5 quarts in a day! The liver is full of tubes (biliary tubing) that deliver the bile to one large tube (the common bile duct). The gallbladder is attached to the common bile duct and acts as a storage reservoir. Eating fat or protein triggers the gallbladder to squeeze itself empty after about twenty minutes, and the stored bile finishes its trip down the common bile duct to the intestine.

For many persons, including children, the biliary tubing is choked with gallstones. Some develop allergies or hives but some have no symptoms. When the gallbladder is scanned or X-rayed nothing is seen. Typically, they are not in the gallbladder. Not only that, most are too small and not calcified, a prerequisite for visibility on an X-ray. There are over half a dozen varieties of gallstones, most of which have cholesterol crystals in them. They can be black, red, white, green or tan colored. The green ones get their color from being coated with bile. Notice in the picture (pg. 545) how many have imbedded unidentified objects. Are they fluke remains? Notice how many are shaped like corks with longitudinal grooves below the tops. We can visualize the blocked bile ducts from such shapes. Other stones are composites made of many smaller ones- showing that they regrouped in the bile ducts some time after the last cleanse.

At the very center of each stone is found a clump of bacteria, according to scientists, suggesting a dead bit of parasite might have started the stone forming. As the stones grow and become more numerous the back pressure on the liver

causes it to make less bile. Imagine the situation if your garden hose had marbles in it. Much less water would flow, which in turn would decrease the ability of the hose to squirt out the marbles. With gallstones, much less cholesterol leaves the body, and cholesterol levels rise.

Gallstones, being porous, can pick up all the bacteria, cysts, viruses and parasites that are passing through the liver. In this way "nests" of infection are formed, forever supplying the body with fresh bacteria. No stomach infection such as ulcers or intestinal bloating can be cured permanently without removing these gallstones from the liver. Cleanse your liver twice a year

Preparation

You can't clean a liver with living parasites in it. You won't get out many stones, and will feel quite sick. Zap daily the week before, or get through the first three weeks of the parasite killing program before attempting a liver cleanse. If you are on a parasite maintenance program, do a high dose program the week before. Completing the kidney cleanse before cleansing the liver is also recommended. You want your kidneys, bladder and urinary tract in top working condition so they can efficiently remove any undesirable substances incidentally absorbed from the intestine as the bile is being excreted. Do any dental work first, if possible. Your mouth should be metal free and bacteria free (cavitations are cleaned). A toxic mouth can put a heavy load on the liver, burdening it immediately after cleansing. Eliminate that problem first for best results.

(Editor's note: Kidney cleansing is optional when using the liver cleanse in cases of yeast overgrowth. Zapping refers to the use of an electrical device developed by Dr. Clark, please see her book

"The Cure for all Diseases": Copyright 1995 by Hulda Regehr Clark, Ph.D., N.D. for details)

Choose a day like Saturday for the cleanse, since you will be able to rest the next day.

Take no medicines, vitamins or pills that you can do without; they could prevent success. Stop the parasite program and kidney herbs too, the day before.

Eat a no-fat breakfast and lunch such as cooked cereal with fruit, fruit juice, bread and preserves or honey (no butter or milk), baked potato or other vegetables with salt only. This allows the bile to build up and develop pressure in the liver. Higher pressure pushes out more stones.

2:00 PM

Do not eat or drink after 2 o'clock. If you break this rule you could feel quite ill later.

Get your Epsom salts ready. Mix 4 tbs. in 3 cups water and pour this into a jar.

This makes for servings, 3/4 cup each. Set the jar in the refrigerator to get ice cold (this is for convenience and taste only).

6:00 PM

Drink one serving (3/4 cup) of the ice cold Epsom salts. If you did not prepare this ahead of time, do it right now. You may also add 1/8 tsp. vitamin C powdered to improve the taste. You may also drink a few mouthfuls of water afterwards or rinse your mouth. Get the olive and grapefruit out to warm up.

8:00 PM

Repeat by drinking another 3/4 cup of Epsom salts. You haven't eaten since two o'clock, but you won't feel hungry. Get your bedtime chores done. The timing is critical for success; don't be more than 10 minutes early or late.

9:45 PM

Pour 1/2 cup (measured) olive oil into a pint jar. Squeeze the grapefruit by hand into the measuring cup. Remove pulp with fork. You should have at least 1/2 cup, more (up to 3/4 cup) is best. You may top it up with lemonade. Add this to the olive oil. Close the jar tightly with the lid and shake hard until watery (only fresh grapefruit does this).

Now visit the bathroom one or more times, even it makes you late for your ten o'clock drink. Don't be more than 15 minutes late.

10:00 PM

Drink the oil and juice mixture. (The following is optional / editor) Take 4 ornithine capsules with the first sips to make sure you will sleep through the night. Take 8 if you already suffer from insomnia. Drinking through a large plastic straw helps it go down easier. Take it to your bedside if you want, but drink it standing up. Get it down within 5 minutes (fifteen minutes for very elderly or weak persons).

Lie down immediately. You might fail to get stones out if you don't. The sooner you lie down the more stones you will get out. Be ready for bed ahead of time. Don't clean up the kitchen. As soon as the drink is down walk to your bed and lie down flat on your back with your head up high on the pillow. Try to think about what is happening in the liver. Try to keep perfectly still for at least 20 minutes. You may feel a train of stones traveling along the bile ducts like marbles. There is no pain because the bile duct valves are open (thank you Epsom salts!). Go to sleep. You may fail to get stones out if you don't

Next Morning

Upon awakening take your third dose of Epsom salts. If you have indigestion or nausea wait until it is gone before drinking the Epsom salts. You may go back to bed. Don't take this potion before 6:00 AM.

2 Hours Later

Take your fourth (the last) dose of Epsom salts. Drink 3/4 cups of the mixture. You may go back to bed.

After 2 more hours you may eat. Start with fresh fruit juice (vegetable juice if suffering from candidiasis). Half an hour later eat fruit (vegetables if suffering from candidiasis). One hour later you may eat regular food but keep it light. By supper you should feel recovered.

How Well Did You Do?

Expect diarrhea in the morning. Use a flashlight to look for gallstones in the toilet with the bowel movement. Look for the green kind since this is proof that they are genuine gallstones, not food residue. Only bile from the liver is pea green. The bowel movement sinks but gallstones float because of the cholesterol inside.

Count them all roughly, whether tan or green. You will need to total 2,000 stones before the liver is clean enough to rid you of allergies or bursitis or upper back pains permanently. The first cleanse may rid you of them for a few days, but as the stones from the rear travel forward, they give you the same symptoms again. You may repeat cleanses at two week intervals. Never cleanse when you are ill. [HPS editors note: I started passing chaff through normal bowel movements after my 4th colon cleansing fast, approximately after a total of $4 \times 14 = 56$ days of total colon cleansing within 9 months. The chaff continued in normal bowel movements for 8 months!]

Thousands of tiny stones, looked like small popcorn and small bee pollen granules, others looked like moth wings. Sometime I would drop at one bowel movement 50-100 pea size stones that would float in the water. It was truly an

experience. Almost daily for 8 months! When I did my first Dr. Clark's liver cleanse I immediately dropped over 200 pea size green and tan stones, and when I examined them I was shocked. They crushed in my fingers and what I found was pure fat, pure cholesterol. Can you imagine hundred of them. Also in my second liver cleanse I had the same experience].

Sometimes, the bile ducts are full of cholesterol crystals that did not form into round stones. They appear as a "chaff" floating on top of the toilet bowl water. It may be tan colored, harboring millions of tiny white crystals. cleansing this chaff is just as important as purging the stones.

How Safe Is The Liver Cleanse?

It is very safe. My opinion is based on over 500 cases, including many persons in their seventies and eighties. None went to the hospital; none even reported pain. However it can make you feel quite ill for one or two days afterwards, although in every one of these cases the maintenance parasite program had been neglected. This is why the instructions direct you to complete the parasite and kidney rinse program first.

This procedure contradicts many modern medical viewpoints. Gallstones are thought to be formed in the gallbladder, not the liver. They are thought to be few, not thousands. They are not linked to pains other than gallbladder attacks. It is easy to understand why this thought: by the time you have acute pain attacks, some stones are in the gallbladder, are big enough and sufficiently calcified to see on X-ray, and have caused inflammation there. When the gallbladder is removed the acute attacks are gone, but the bursitis and other pains and digestive problems remain.

The truth is self-evident. People who have had their gallbladder removed surgically still get plenty of green, bile coated stones, and anyone who cares to dissect their stones can see that the concentric circles and crystals of cholesterol match textbook pictures of "gallstones" exactly."
